PROCEDURE NOTE

FILE COPY

APPLEGATE, WILLIAM
#28-15-20

THOMAS A. DICKINSON, M.D.

DATE OF BIRTH: 31, January, 1949 AGE: 37

DATE OF PROCEDURE: 11, July, 1986

INDICATIONS: Severe peptic stricture of the esophagus with recurrent dysphagia. The patient underwent Maloney dilatation three to four weeks ago but has had persistent dysphagia.

PROCEDURE: Esophagoscopy with Savary dilatation of the esophagus was performed today without complications.

SCOPE: Olympus.

MEDICATION: Valium 15 mg IV; Demerol 50 mg IV.

FINDINGS: The endoscope was inserted without difficulty into the proximal portion of the esophagus.

ESOPHAGUS-BODY,
GU JUNCTION:

There was a tight peptic stricture at the distal esophagus with considerable ulceration erosion. The XQ scope cannot be passed through this area. As a result, a guide wire was placed through the strictured area. Over the guide wire, serial Savary dilators were passed from 27-42 French. The guide wire and the dilators were then withdrawn. The endoscope was then inserted and passed easily through the strictured area into the proximal portion of the stomach. There was a large hiatal hernia present.

IMPRESSION:

Tight peptic stricture of the distal esophagus, status post Savary dilatation.

THOMAS A. DICKINSON, M.D.
